Introduction

This Guidance is a reference to assist you in completing the Sudden Death in the Young Autopsy Summary. It will guide you through the steps necessary to conduct a comprehensive autopsy of a sudden and unexpected death in a child or youth under age 20. It includes instructions for specific components of the autopsy.

The SDY Autopsy Guidance was developed as part of the SDY Case Registry, an initiative of the National Institutes of Health and the US Centers for Disease Control and Prevention. A committee of medical experts representing forensic pathology, cardiac pathology, neuropathology, pediatric medical specialties and death investigators developed this guidance.

Your jurisdiction is participating in the Sudden Death in the Young Case Registry with funding from the NIH and CDC. The autopsy findings will be summarized with other case review information and biospecimen data (upon family consent) into the SDY Case Registry. This Registry of de-identified data will be used to better understand the etiologies and risk factors for sudden death in the young so that improved prevention strategies may be developed.

Additional instructions and information are provided throughout this document in italics and footnotes.

**SDY Definitions and Inclusion/Exclusion Criteria for the SDY Case Registry**

“Sudden” implies death within 24 hours of the first symptom, or those resuscitated from cardiac arrest and dying during the same hospital admission.

“Unexpected” refers to a death in someone who dies from an accidental injury or someone who was believed to have been in good health, or had a stable chronic condition or had an illness but death was not expected. Examples could include hypertrophic or dilated cardiomyopathy, congenital heart disease, epilepsy, asthma and pneumonia.

**Inclusion and Exclusion Criteria**

This autopsy results summary sheet is a key component of the SDY Case Registry and should be used for all cases that meet all of the following inclusion criteria and none of the following exclusion criteria:

<table>
<thead>
<tr>
<th>Inclusion Criteria</th>
<th>Yes, Include</th>
<th>No, Exclude</th>
</tr>
</thead>
<tbody>
<tr>
<td>Is the child under 20 years old?</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Was the death sudden and unexpected and/or unwitnessed?</td>
<td>Yes, Include</td>
<td>No, Exclude</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Exclusion Criteria</th>
<th>Yes, Exclude</th>
<th>No, Include</th>
</tr>
</thead>
<tbody>
<tr>
<td>Was the death caused by an accident in which the external cause was the obvious and only reason* for the death?</td>
<td>Yes, Exclude</td>
<td>No, Include</td>
</tr>
</tbody>
</table>

*Exception: All infants under 1 year of age whose death was caused by suffocation |

<table>
<thead>
<tr>
<th>Was the death an obvious homicide?</th>
<th>Yes, Exclude</th>
<th>No, Include</th>
</tr>
</thead>
<tbody>
<tr>
<td>Was the death an obvious suicide?</td>
<td>Yes, Exclude</td>
<td>No, Include</td>
</tr>
<tr>
<td>Was the death caused by an accidental or intentional overdose of drugs even if this caused cardiac or respiratory arrest?</td>
<td>Yes, Exclude</td>
<td>No, Include</td>
</tr>
<tr>
<td>Was the death caused by a terminal illness in which the death was reasonably expected to occur within 6 months?</td>
<td>Yes, Exclude</td>
<td>No, Include</td>
</tr>
</tbody>
</table>
General

Sex:  □ Male  □ Female
Body weight: ___________ kg  Body length: ___________ cm
Head circumference: ___________ cm
External Exam: If abnormalities suggestive of trauma, disease/syndrome, or medical intervention, please describe:

Photography (external) □ yes  □ no

Imaging

(Circle all that were performed and describe the location)
X-Ray, single:

X-Ray, multiple views:

CT scan:

MRI:

Describe any abnormalities found on imaging:

Detailed Review of Specified Organs

Thorax/Lungs

Thorax/Lungs Imaging:
• If there is a question about the possibility of extra lobar or intra-lobar sequestration, or congenital pulmonary adenomatoid malformation (CPAM; old name CCAM), remove the heart, lungs, central diaphragm, inferior vena cava, and descending aorta as a block, and send for pediatric pathology consultation.

Radiographs of chest □ Prior to death (hospital, emergency room, other)  □ Postmortem

Thorax/Lungs – External Gross Examination

Chest:
Contour □ Normal  □ Abnormal
If abnormal □ Increased anteroposterior diameter  □ Asymmetry
Costal margin flaring □ Other:
Injuries □ Absent  □ Present:
Axillary lymphadenopathy □ Absent  □ Present
Other:
Nasal choanae (infants)\(^1\) □ Patent  □ Obstructed

\(^1\)Testing to see if the nasal choanae are patent may be performed by sounding each nostril with a flexible probe. This can be performed with the nasopharyngeal swab for viral culture.
### Thorax/Lungs – Internal Gross Examination

- **Photography:** (optional)  
  - In situ  
  - On cutting board  
- **Testing:** sampling for viral and bacterial cultures (as indicated)

**Tracheal deviation**
- Absent  
- Present  
- Left  
- Right

**Lungs:**
- Pneumothorax
  - Absent  
  - Present  
  - Left  
  - Right  
  - Bilateral
- If present, diagnosed by
  - X-ray  
  - Other means:

**Hypoinflation**
- Absent  
- Present  
- Left  
- Right  
- Bilateral
- Lung(s) sunken towards the back
  - Absent  
  - Present  
  - Left  
  - Right  
  - Bilateral

**Hyperinflation**
- Absent  
- Present  
- Left  
- Right  
- Bilateral
- Lungs do not approach midline  
- Approach midline  
- Meet in midline

**Color**
- Pink  
- Dark red  
- Alternating pink and purple  
- Fibrinous/purulent exudate  
- Dark red in all lobes, posterior only
- Other:

**Pleural effusion**
- Absent  
- Present  
- Left  
- Right  
- Bilateral
- If present, appearance
  - Clear  
  - Bloody  
  - Straw  
  - Purulent  
  - Other:

**Hemidiaphragm elevation**
- Absent  
- Present  
- Left  
- Right  
- Bilateral

**Pleural effusion**
- Amount: ml

### Thorax/Lungs – Gross Dissection

- Take heart and lungs out as a block after inspecting aorta for vascular ring around trachea, and inspecting pulmonary arteries and veins (see heart section).
- The trachea/upper respiratory tract should be removed as a block with the lungs.

**Vascular ring (aorta around trachea)**
- Absent  
- Present

**Lungs:**
- Blood on the pleural surface (adherent hemothorax)
  - Absent  
  - Present  
  - Acute  
  - Chronic
- Blood beneath the pleura
  - Absent  
  - Present: Petechiae  
  - Confluent/Large hemorrhages
- Necrotic exudate on the pleural surface
  - Absent  
  - Present
- Prominent/discolored/dilated lymphatics visible through the pleura
  - Absent  
  - Present
- Cobblestoning
  - Absent  
  - Present
- Rib markings on the pleura
  - Absent  
  - Present

**Other:**

- Perform the initial examination of the heart/lung block. If a cardiovascular pathology or pediatric pathology consultation is requested send the heart/lung block to consultant. If consultation is not requested separate the lungs from the heart following initial examination.

**Lung weights within normal range for age**
- Yes  
- No:  
- Increased  
- Decreased

**Right lung approximately 1/3 heavier than the left lung**
- Yes  
- No:

**Resuscitation-related changes**
- Absent  
- Present:

**Pulmonary edema, NOS**
- Absent  
- Present:

**Neurogenic pulmonary edema**
- Absent  
- Present:

**Pulmonary infection**
- Absent  
- Present:

**Pulmonary hemorrhage**
- Absent  
- Present:

  - If present:
    - Diffuse  
    - Focal, location:
    - Aspiration pattern (follows bronchi)

**Pulmonary hypertension**
- Absent  
- Present

**Other:**

1. Do the lungs approach each other or meet in the midline?
2. Probable postmortem change
3. Areas of pink hyperinflation and purple hypoinflation
4. Consider SUDEP
5. Muscle layers in subpleural arterioles

---

**SUDDEN DEATH IN THE YOUNG AUTOPSY GUIDANCE**

---

**PAGE 3**
**Thorax/Lungs – Gross Dissection (continued)**

Abnormalities/disease processes visible at the hilum of either lung:

<table>
<thead>
<tr>
<th>Pulmonary artery thromboemboli⑦</th>
<th>□ Absent □ Present location:__________________________</th>
</tr>
</thead>
<tbody>

<td>Congenital anomaly</td>
<td>□ Absent □ Present:__________________________</td>
</tr>
<tr>
<td>Other:</td>
<td></td>
</tr>
</tbody>
</table>

⑦If there is any question whether blood clots in the mainstem pulmonary artery branches are antemortem thromboemboli or postmortem clot, histology is definitive.
⑧Three lobes on the right and two lobes on the left
⑨Does the main bronchus enter the hilum above, or approximately level with, the mainstem pulmonary artery branch on the right side (normal right eparterial bronchus), and below the mainstem pulmonary artery branch on the left side (normal left hyparterial bronchus)? If abnormal, consider pediatric pathology consultation.
⑩Look for polysplenia.
⑪Look for asplenia.
⑫Look for Kartagener syndrome.
⑬Consider asthma.
⑭Consider infection or sarcoidosis.
⑮Propagation of thromboemboli causes red-purple “sausages” to exude from cross-sectioned pulmonary artery branches.
**Thorax/Lungs – Microscopic Examination**

- **Central**
- **Peripheral:** including pleura and subpleural pulmonary artery branches and medium-sized bronchi
- **Through areas of grossly evident or suspected disease processes**
- **There is no definitive number of lung sections supported by research that can be stated as required in every case. Peripheral and central lung samples each yield different diagnoses, and both should be sampled. Sampling from multiple areas may detect patchy diseases. Grossly suspicious areas are likely to reward sampling. Storage of multiple lung segments allows further sampling if disease processes are detected that require it. If in doubt, consult a pediatric pathologist.
- **Obtain special stains as indicated for:**
  - Bacterial infection
  - Granulomatous disease (acid-fast bacteria, sarcoidosis, fungi)
  - Autoimmune disease
  - Neoplasia
  - Resolving hemorrhage (iron)

| Pulmonary hypertension or evidence of persistent fetal circulation\(^{16}\) | Absent | Present: |
| Asthma or other eosinophilic diseases | Absent | Present: |
| Foreign bodies\(^{17}\) | Absent | Present: |

**Trachea:**

- Methods of examining the trachea should include opening along the long axis and cross-sectioning.
- The neck contents (proximal esophagus, trachea, thyroid gland, and overlying strap muscles) may be cross-sectioned together in one piece for histologic examination, particularly if tracheal/bronchial infection or narrowing of the lumen are of concern.
- Areas not cross-sectioned may be opened along the long axis. The epiglottis is easily sectioned. The aryepiglottic folds may be sectioned to look for eosinophils.
- The carina lends itself to a triangle-shaped sagittal cross-section that includes the carinal nodes.
- Trachea should be removed, including the hyoid bone, epiglottis, aryepiglottic folds, arytenoid cartilage, thyroid cartilage, trachea, and carina.

| | | | | \(^{16}\)Including muscle layers in subpleural arterioles; other abnormalities of pulmonary artery branches

\(^{17}\)Consider polarization to look for talc in granulomata.
**Heart – Gross Dissection**

- Weigh the heart
- Make note of epicardial adhesions, exudate, or discoloration
  - Make note of amount and distribution of epicardial fat
- Section the epicardial coronary arteries at 3-5 mm intervals, avoiding cutting into great arteries and cardiac chambers
  - Note arterial dominance (right/left/shared) and locations and degrees of obstructions
- Make transverse (short axis) slices through the ventricles beginning 1 cm above the apex and at 1 cm intervals; do not section above the level of the tips of the left ventricular papillary muscles
  - Note all gross lesions in the myocardial sections including scars, discolorations, and softenings
  - Lesions should be described by the usual descriptors (e.g., size, color, firmness) as well as:
    - Vertical location (e.g., basal, midventricular, apical)
    - Lateral location (e.g., anteroseptal, inferolateral)
    - Distribution (e.g., subendocardial, transmural, subepicardial, random)
      - Take measurements of left ventricular thickness, right ventricular thickness, and septal thickness in the uppermost (most basal) slice
- When taking measurements, include only the compact myocardium; do not include trabecular muscle or papillary muscles
  - Examine the right ventricular wall for fat infiltration
  - It is recommended that the myocardial slices be photographed, especially if there are grossly visible lesions
- Open the heart in the direction of blood flow:
  - Open from the right atrium to the right ventricle along the posterior and/or lateral wall
  - Open the left atrium by connecting all of the pulmonary veins and cutting to the tip of the atrial appendage
- Remove postmortem clot from all chambers
  - If large amount of postmortem clot is present, consider re-weighing heart after the clot is removed
- Describe degree of dilation of chambers, if any, and document presence/absence of mural thrombi
- Document presence/absence of patent foramen ovale, atrial septal defect, or ventricular septal defect (describe size and location if present)
- Examine the valves, noting number of leaflets/cusps of each and presence of any abnormalities (e.g., myxoid change, calcification, vegetations)
- Examine the coronary ostia
  - If ectopic origin is present, note acuity of the origin (e.g., sharp angle of origin), course of the proximal segment of the artery (e.g., within aortic adventitia), and presence/absence of an occlusive ostial flap
- If any of the above findings are present, it is recommended that they be photographed in addition to being described in the autopsy protocol

- Cavitary thrombus
  - Absent
  - Present:
- Endocardium
  - Thin, translucent (normal)
  - Abnormal:
- Myocardial infarction (acute/recent)
  - Absent
  - Present:
- Myocardial scar
  - Absent
  - Present:
- Myocardial discoloration
  - Absent
  - Present:

20 Left atrial morphology includes absence of terminal crest and smooth endocardial surface throughout atrium except for pectinate muscles in atrial appendage.
21 Description should include location, size, and any intervention.
22 Describe morphology and pathology under "Left atrioventricular valve" section.
23 Right ventricular morphology includes coarse endomyocardial trabeculations and presence of a moderator band.
24 Measurements should be taken at the level of the tips of the ventricular papillary muscles and should include only the compact myocardium (not epicardial fat or papillary/trabecular muscle).
25 Concerning for arrhythmogenic right ventricular cardiomyopathy
26 Concerning for arrhythmogenic right ventricular cardiomyopathy
27 Left ventricular morphology includes fine endomyocardial trabeculations and absence of a moderator band.
28 Measurements should be taken at the level of the tips of the left ventricular papillary muscles and should include only the compact myocardium (not epicardial fat or papillary/trabecular muscle).
29 Includes remote myocardial infarctions
### Heart – Gross Examination (continued)

#### Ventricular septum

- **Septal thickness**: 30 cm
- **Intact**: Yes
- **Ventricular septal defect**: Present

#### Semilunar valves

<table>
<thead>
<tr>
<th>Two valves</th>
<th>Single valve</th>
<th>Truncus arteriosus, pulmonary or aortic atresia</th>

#### Right semilunar valve

- **Number of cusps**: 3
  - **Normal**: Yes
  - **Absent**: No
  - **Other**: Present: If present, circle/describe all that apply:
    - Vegetations
    - Thickening
    - Calcification
    - Perforation
    - Commisural fusion
  - **Prosthetic (type)**: Present

- **Number of cusps**: 2
  - **Bicuspid**: Yes
  - **Absent**: No
  - **Other**: Present: If present, circle/describe all that apply:
    - Vegetations
    - Thickening
    - Calcification
    - Perforation
    - Commisural fusion
  - **Prosthetic (type)**: Present

#### Left semilunar valve

- **Number of cusps**: 3
  - **Normal**: Yes
  - **Absent**: No
  - **Other**: Present: If present, circle/describe all that apply:
    - Vegetations
    - Thickening
    - Calcification
    - Perforation
    - Commisural fusion
  - **Prosthetic (type)**: Present

- **Number of cusps**: 2
  - **Bicuspid**: Yes
  - **Absent**: No
  - **Other**: Present: If present, circle/describe all that apply:
    - Vegetations
    - Thickening
    - Calcification
    - Perforation
    - Commisural fusion
  - **Prosthetic (type)**: Present

#### Great vessels

- **Pulmonary artery**: Normal
  - **Dilated**: No
  - **Hypoplastic**: Yes
  - **Absent**: No
  - **Present**: Yes
  - **Discontinuous branch pulmonary arteries**: Yes
  - **Absent**: No
  - **Present**: Yes
  - **Supravalvar pulmonary stenosis**: Yes
  - **Absent**: No
  - **Present**: Yes
  - **Thromboemboli**: Yes
  - **Absent**: No
  - **Present**: Yes
  - **Aorta**: Leftward arch (normal)
    - **Rightward arch**: Yes
    - **Other arch anomaly (e.g., vascular ring)**
  - **Absent**: No
  - **Present**: Yes
  - **Root dilatation**: Yes
  - **Absent**: No
  - **Present**: Yes
  - **Dissection**: Yes
  - **Absent**: No

---

30Measurement should be taken at the level of the tips of the left ventricular papillary muscles.
31Description should include location, size, and any intervention. If malalignment is present (e.g., as in tetralogy of Fallot), describe extent and direction – anterior or posterior.
32Describe morphology/pathology in “Left semilunar valve” section.
33D-malposition is commonly referred to as “complete transposition” (i.e., aorta is anterior and rightward of the pulmonary artery).
34The aorta is the vessel that gives rise to the coronary arteries.
35“Normal” includes origin of the conus artery adjacent to right coronary ostium (normal variant).
36The right coronary artery may be small in left-dominant hearts. Describe in further detail in “Other” section if absent/hypoplastic or if downstream sequelae exist (e.g., myocardial infarction).
If atherosclerosis is present, fill out the following table:

<table>
<thead>
<tr>
<th>Coronary Artery</th>
<th>Greatest % obstruction</th>
<th>Proximal</th>
<th>Mid</th>
<th>Distal</th>

- Ventricular assist device: (type, location)
  
  Evidence of congenital heart surgery: (type, location)
  
  Stents/coils/plugs/occluder devices: (location)
  
  Other: ______

$^{37}$“Normal” includes origin of the conus artery adjacent to right coronary ostium (normal variant).

$^{38}$Probe patent foramen ovale is considered a normal variant and should not be included under congenital heart disease.

$^{39}$Surgical status will be recorded under evidence of cardiovascular interventions.

$^{40}$With the exception of valve prostheses, which should be described in the valve sections above.
Heart – Microscopic Examination

The extent of microscopic examination is guided by the available history and the gross findings.

For a grossly normal heart, at a minimum:
- 2 sections of left ventricle that include the anterolateral and posteromedial papillary muscles
- 1 section of basilar ventricular septum
- 1 section of right ventricle
- An additional 4-6 sections of myocardium taken from a variety of locations in the ventricles and septum (to look for myocarditis, which can be patchy; if there is recent history of viral illness, it is advisable to take more)

Myocardium:
- Take sections of any areas of discoloration, softening, or mass.
- Taking sections of old myocardial infarction scars is usually uninformative, but areas of myocardium with randomly dispersed interstitial scars should be sampled.
- In cases of suspected hypertrophic cardiomyopathy, the ventricular septum should be carefully sampled to look for myocyte disarray.
- In cases of suspected arrhythmogenic right ventricular cardiomyopathy, multiple sections of the anterior and posterior walls of the right ventricle should be taken.

Make note of:
- Hypertrophy
- Myocyte disarray
- Necrosis (coagulative vs. contraction-band; focal vs. geographic; specific distribution)
- Fibrosis (replacement vs. interstitial; specific distribution)

Coronary arteries:
- Take sections of the greatest area of obstruction of each artery.
- Take sections of any other grossly visible lesion (e.g., aneurysm, dissection); consider including elastic stain.

Valves:
- Take sections of any vegetations (consider including Brown & Brenn tissue gram stain).
- Take a section of a mitral leaflet if it appears to have myxoid degeneration (include an Alcian Blue (AB)-Periodic acid-Schiff (PAS) stain).

Conduction system:
- Examination of the conduction system should be done in all cases where:
  - There is documented history of heart block, OR
  - The decedent is an infant/small child and there is a known history of maternal lupus, OR
  - Myxoid valvular disease is present.
- If number of histology blocks is not a financial consideration, doing microscopic examination of the conduction system should be considered in any apparent sudden cardiac death case.

Brain – Gross Examination

- Photographs should be taken with the brain in place and cranial vault removed. This is helpful for evaluation of brain swelling. All photographs should be made with a ruler:
  - Photographs: Vertex view Right view Left view Base View
- Photographs:
  - Epidural surface of dura mater
  - Subdural surface of dura mater
  - Dorsal brain
  - Ventral brain
  - Right side of brain
  - Left side of brain
  - Evidence of surgical intervention

Evidence of surgical intervention:
- Craniotomy:
- Craniectomy:
- Hardware in skull:
- Dural grafts:
- Tubes, drains:
- Dural sinus thrombosis:
- Subdural hemorrhage:
  - If present: Amount ml
  - Color

Subdural hemorrhage:
- Absent
- Present: Left Right Bilateral

-A number of histology blocks is not a financial consideration, doing microscopic examination of the conduction system should be considered in any apparent sudden cardiac death case.

---

SUDDEN DEATH IN THE YOUNG AUTOPSY GUIDANCE

A stepwise description of the technique can be found in Gulino SP. Examination of the cardiac conduction system: forensic application in cases of sudden cardiac death. Am J Forensic Med Pathol 2003;24(3):227-38.

| Brain weight (unfixed) | | |
|------------------------| | |

- Fix brain in 10 – 20% buffered formalin for 2 weeks or longer.\(^{43,44}\)

- Suspend brain so that is not deformed by container. This can be done by suspension with a thread under the basilar artery or by using concentrated formalin until the brain floats.

- Request antemortem imaging reports if available for review prior to cutting.

---

\(^{42}\) Removal by forensic pathologist is recommended. This decreases the chances of artifacts, such as tearing of cranial nerves.

\(^{43}\) Skip this step if the brain is very fragile and the brain can be fixed.

\(^{44}\) Except in jurisdictions in which this is not allowed.

\(^{45}\) In some jurisdictions the family must be notified if the brain is retained for fixation.

\(^{46}\) As in a malformation such as Arnold Chiari

**Specimens**

The following should not be construed as requiring every sample for every examination, but should guide the autopsy physician’s selection of specimens recovered based upon antemortem signs and symptoms and postmortem anatomic findings.

- Nasopharyngeal swab for viral culture
- Cerebrospinal fluid
- Blood cultures  
  - Aerobic  
  - Anaerobic
- Trachea  
  - Culturette  
  - Fresh tissue (obtained in a sterile fashion)
- Bronchus  
  - Culturette  
  - Fresh tissue (obtained in a sterile fashion)
- Lung culturette(s)  
  - Right upper lobe  
  - Right middle lobe  
  - Right lower lobe
  - Left upper lobe  
  - Left lower lobe
- Sterilely obtained fresh lung tissue  
  - Right upper lobe  
  - Right middle lobe  
  - Right lower lobe
  - Left upper lobe  
  - Left lower lobe
- Stool sample

Were additional specialists consulted on this autopsy (e.g., cardiac pathologist, neuropathologist)?  
- Yes  
- No

If yes, specify:

---

*Small tissue samples in formalin.

†Neck structures include: epiglottis, aryepiglottic folds, arytenoid and thyroid cartilage to include the vocal cords, cricothyroid membrane, the cricoid cartilage and the tracheal rings, thyroid gland, strap muscles, and the vessels and nerves including those within the carotid sheath and tongue. Under 1 y.o. include the subglottic musculature.

††In infants the thyroid may be too small to weigh.

‡‡Body cavities include the pleural, peritoneal and pericardial cavities and pelvis.
### Tissue Sampling and Histology

<table>
<thead>

### Final Pathologic Diagnosis

Was the family referred to a tertiary care center with subspecialty expertise relevant to the cause of death (e.g., cardiology, neurology) for screening of at-risk relatives and genetic counseling?

- Yes
- No
- N/A

Where:
